<p><b>Special model</b></p>	<p><b>CAR-12AS</b>  High-speed automatic die cutting machine, using optical registration. Machine output is 46,000 cards per hour for a 10 by 7 rows card sheet.</p>		
<p><b>Cut cards collection system</b></p>	<p>Machine can use male &amp; female, steel rule and compound dies. When using the male &amp; female die, the CR 80 cards are consolidated to form a stack and is pushed into two magazines by a transporting device under the die. For large cards or non-standard cards, the cut parts drop directly onto a conveyor under the cutting head and the conveyor feeds them out.</p>		
<p><b>Manual 4 post mechanical stops</b></p>	<p>Steel rule dies are used when the cut parts are not CR-80 cards or are kiss cut with through cutting. Using steel rule dies allows the cutting of different card shapes and can be easily changed. Cost of the die is much less than a male and female die. Mechanical stops are used to control the cutting stroke when using steel rule dies.</p>		
<p><b>Auto sheet feeder</b></p>	<p>Material can be loaded on an automatic sheet feeder. The operator saves time in handling the sheet material.</p>
