	<p>CAR-5P</p> <p>The machine is a playing card automatic cutting and stacking system. The CAR-5P cutting speed has been significantly increased.</p>		
<p>Achieving high output</p>	<p>In order to increase output, it is necessary to increase the cut card collection speed and decrease the cutting dwell time. In order to achieve these goals, the male and female die has designed with an anti-adhesion device. It ensures that the cut cards do not touch the male die. This machine has the capability of producing 530 sets of playing cards per hour for a 6 by 9 row card sheet.</p>		
			
<p>Cut cards stacking</p>	<p>The playing cards are stacked into the first magazine with each set in order. When the magazine reaches capacity, sensors at the top will signal the machine to automatically switch to the second magazine. Once both magazines are full, the machine will stop operation.</p>		
			
<p>Other features</p>	<p>This machine retains the convenient features of the CAR-5N. These include the auto sheet feeder, high-precision sensors with a registration mark tracking system to ensure a cut to-print accuracy of +/- 0.1mm and automatic scrap web removal.</p>
