	<p><b>HCV-3K</b></p> <p>HCV-3K is an advanced automatic machine designed to produce personalized cards from start to finish; with speed, accuracy and excellent results.</p> <p>Material is first placed on the feed table. The machine will punch pinholes and glue the three material layers (core material and two overlays).</p>		
<p><b>Preparation, lamination and punching station</b></p>	<p>After gluing, the lamination is done automatically. This includes feeding, preheating, heat pressure sealing, cooling, and sheet removal.</p> <p>The user-friendly screen allows temperature, pressure setting and tracking at every stage of the lamination process.</p> <p>After lamination, the cards are punched for individual inspection.</p>		
<p><b>Inspection station and cut parts collection</b></p>	<p>Cards are inspected for bubbles and print errors. Rejected cards are sent to the reject card magazine.</p> <p>Good cards will collect in the other card magazine.</p>		
<p><b>Performance in Beijing</b></p>	<p>A private exhibition was held in China by the government for officials. Sysco received a lot of inquiries at this exhibition.</p>
