Take a Look at the USA RH3579-60E Machine

The USA RH3579-60E machine was custom designed by request of the international firm Louis Vuitton. Compared to previous Receding Head presses, this machine has many innovations and aesthetic improvements. This machine's outward appearance has been transformed. The rear of the machine has an attractive vertical lifting hinged guard. Also, this machine has more safety features. The bottom right side cover hides the electrical cabinet. There is a light fixture on the top front side of the machine so that the operator can have plenty of light while working.

Features

This machine has improved operator conveniences. A touch screen is equipped on the top left side of the machine. The touch screen allows the operator to easily run the machine. In the past, in order to do a die setting, there were various steps which included: loosening the setting handle, moving the handle up and down, letting it rest in the bottom position and waiting for the contact block to make contact with the cutting stroke limit switch. The die setting process on this new model has been simplified; simply select the setting mode on the touch screen and the die setting will be performed automatically through a motor driven process. This saves time and improves productivity.
